

High-level components for battery energy storage networks

Overview

The battery is a crucial component within the BESS; it stores the energy ready to be dispatched when needed. The battery comprises a fixed number of lithium cells wired in series and parallel within a frame to create a module. The modules are then stacked and combined to form a battery. Any lithium-based energy storage system must have a Battery Management System (BMS). The BMS is the brain of the battery system, with its primary function being to. The battery system within the BESS stores and delivers electricity as Direct Current (DC), while most electrical systems and loads operate on. The HVAC is an integral part of a battery energy storage system; it regulates the internal environment by moving air between the inside and outside of the system's enclosure. If the BMS is the brain of the battery system, then the controller is the brain of the entire BESS. It monitors, controls, protects, communicates, and schedules the BESS's key.
